
H1 held out (Eval A): true Δ regressed on the incumbent C+G predicted Δ
A. 292 knockdowns × gated genes (3.15M pairs), r = 0.144
β = no-intercept OLS slope
perfect: true = predicted
fit, all genes: β = 0.153
fit, called genes: β = 0.177
fit, not-called genes: β = 0.137
true Δ (held-out H1 cells, log1p CP50K)
predicted Δ (C+G, log1p CP50K)
(knockdown, gene) pairs
B. β per knockdown
the signal sits in the strong knockdowns
pooled β = 0.153
median per-knockdown β = 0.034
β = 1 (magnitude right)
β, true Δ on predicted Δ (one knockdown)
true DE genes in the knockdown (0 drawn at 0.8)
